POWERALERT SOFTWARE

UPS systems (also called uninterruptible power supplies) provide comprehensive protection against all power problems, including battery backup that supports your equipment during power failures. UPS systems monitor power conditions and switch connected equipment to battery power when blackouts occur. This allows you to save your data and shut down your equipment in an orderly manner. Tripp Lite's free PowerAlert[®] software will even allow your computer to save your files and shut down automatically during blackouts. Some UPS systems offer expandable battery runtime to accommodate critical equipment like phone systems that must keep running during prolonged blackouts. UPS systems are available in many sizes and models to suit any backup requirement, from a home computer to a large network.

Inverters and inverterchargers turn any vehicle into a convenient power source during prolonged blackouts. They convert DC battery power to AC power to run radios, computers, power tools, appliances, lighting and more.
