The Apple® Laserwriter 16/600 PS is an Apple Laser printer. This printer ships with LocalTalk, Ethernet, and parallel ports. Keyspan® does not offer any products that would connect this printer to a Mac without built-in serial ports. Although Keyspan does sell a USB to serial adapter, serial ports are not the same thing as a LocalTalk port. Because of this technical difference, Keyspan USB to serial adapters will not work with this printer. However, Keyspan does offer a USB to parallel product (<https://www.keyspan.com/products/usb/up6c/>) that may work with this printer under Mac OS X. This would require you to obtain a driver (from Apple or a 3rd party) that would be compatible with: a) your Laserwriter 16/600, b) Mac OS X, and most importantly, c) a USB to parallel cable. This configuration is not supported. This printer can be connected via Ethernet by using an “Ethernet Transceiver” (AAUI to RJ45). Once you connect the Laserwriter 16/600 via Ethernet, you can print from both Mac OS X and Mac OS 9 computers. For more information, read your printer's manual for more information.
